Animal Skull Identification Resources - The Infinite Spider

There are four general regions to a mammal skull: the rostrum, zygomatic arches, braincase and mandibles. The rostrum is the portion of the skull that contains the upper teeth, nose and palate. The zygomatic arches are the bones arching outward from the braincase and rostrum to form the cavities known as the "orbits."

Skull Identification - Alderleaf Wilderness College

The number, shape, and size of teeth can help you determine what type of animal skull you've found. Knowing where molars and premolars begin and end can be tricky. There's no hard and fast rule for telling them apart, and often they can look very similar. The other types of teeth are much easier.

Animal Skull ID: Using Teeth - The Infinite Spider

large opening at the back of a skull which the spinal cord goes through ☐Greatest length of skull- length from tip of rostrum to the posteriormost part of the skull ☐Incisors- anterior-most teeth (front teeth) of mammals ☐Infraorbital foramen-opening below orbit (eye socket) ☐Mandibular mental foramen- foramina (openings) located on the anterior surface of the mandible ☐Molar- teeth located after premolars ☐Orbit- eye socket ☐Paraoccipital process-

Key to Common Mammal Skulls - Maryland

The skull—the collection of bones that house and protect a creature's brain and sensory organs—is the key anatomical feature used to identify an animal and understand many of its behaviors.

Animal Skulls: A Guide to North American Species: Elbroch ...

Skulls hold in place an animal's eyes, ears, and the organs that help it smell and taste. Skulls — and the teeth attached to them — help critters capture and tear apart food. Skulls provide an anchor point for muscles to connect to. Without a skull, animals wouldn't be able to open their pie holes, sing a song, or smile.

Skulls | Missouri Department of Conservation

Animal skulls have evolved for nearly 500 million years to protect the brain and sensory organs in vertebrate animals. Each of the skulls feature mechanisms built to support specific functions, including the obtainment of food and processing, optimal sensory information gathering, and the protection of the brain from trauma.
